

PI NUMBER PT1

Pi Number:

Pi number is one of the most interesting and mysterious number in the all of Universe.

What is it?

At the first times we used Pi to calculate the area and diameter of a circle but now we will use this number from beyond of these 2 things.

The Number of Pi:

3.141592....

The Digits of this number is infinity and then when is not infinity there is nothing called circle in this world and we have to change lot of cosmetic formulas.

How we calculate Pi?

The First formula is Diameter/Radius in all circles this formula will give us The Pi number

For Example:

Diameter of a circle with a radius of 4 is: (pi=3.1415)

$$A=2*\pi*r$$

$$2*3.1415*2=12.566$$

And if we divide this number by the radius that is 4 it will give us the pi number

Type 2:

First, we divide pi from 4 and then we do this formula:

$$(1-1) + (1-3) - (1-5) + (1-7) - (1-9) \dots$$

This method will build the pi numbers after a long amount of numbers

For example, for building 3.14 the numbers are gone to like 500

Example:

$$(1-1) + (1-3) \dots\dots\dots (1-17)$$

If we multiply this number by 4 we will get 3.2533...

So, for this formula we have to go to a very high number for just to calculate 3.1415 like I said they gone to 500 (or around) just for calculate 3.14!
